

Job Description

Job Title: Digital Automation & AI Transformation

Work Location:

OFF BLR Embassy Tech Village Business Park_IN-KA (2900248)

About the Role:

In the Supply Chain Digital Automation team, you will drive operational excellence through technical innovation and high-velocity execution. This is a techno-functional role where success is measured by the tangible business value of the applications you build. You will focus on diagnosing supply chain leakages—such as fraud and bottlenecks—using AI-first solutions. You will be involved in the entire solution lifecycle—from on-ground POC to massive scale-up—ensuring every tool is robust and enterprise-grade.

About the Team

Flipkart is making eCommerce happen in India. Supply chain is the backbone of the Flipkart ecosystem. We in the Digital Automation team have the responsibility of making this supply chain faster, cost-effective, and error-free. We customize technologies and build applications to our needs and then design and deploy the solution across our network. As the nature of work is highly exploratory and innovative, the team structure is flat and highly collaborative. Our team works closely with the design team, operations team, product and tech teams, and multiple other stakeholders as required for each initiative, to drive the project from concept to execution. We take pride in quick prototyping, testing deep waters early on with on-ground POC, and launching robust products at scale with unprecedented velocity. At Flipkart, a high focus on Impact and Ownership allows for freedom for each to experiment and innovate. The automation DNA requires one to take risks, tread on unknown territory, and bring positive impact on business. We as a team have created many patented technologies & India-first digital solutions and will continue doing so.

Key Responsibilities

- **Business Problem Diagnosis:** Support the identification of supply chain losses and productivity improvements.
- **Implementing Agentic Systems:** Assist in the design and implementation of Agentic AI frameworks and LLM/VLM tools.
- **Full-Stack Development:** Write clean, maintainable, and efficient code.
- **AI Code Optimization:** Deeply understand and optimize code written by AI to ensure reliability.

- DevOps & Infrastructure: Support the deployment and scaling of applications using Kubernetes and CI/CD pipelines.
- Monitoring: Implement observability frameworks to track system health and accuracy metrics.
- End-to-End Ownership: Participate in the full SDLC, ensuring digital products are simple for field executives to use.
- Collaboration: Work with Operations, Process Design, and Engineering teams to drive projects to execution.

To Succeed in this Role - You Should Have:

- Educational Excellence: Bachelor's or Master's Degree in Computer Science or related field.
- Technical Experience: Proven experience in web development and building scalable applications.
- Agentic AI Interest: Working knowledge or strong willingness to learn Agentic AI platforms and LLM tools.
- Infrastructure Skills: Hands-on experience or knowledge of Kubernetes and CI/CD pipelines.
- Problem-Solving Mindset: A strong "bias for action" and holistic perspective.
- Communication: Strong verbal and written skills to communicate technical concepts clearly.
- Adaptability: A strong willingness to learn on the job and travel to on-ground sites to solve operational challenges.
